

**ELECTRICITY INDUSTRY REFORMS
IN THAILAND:
A COMPREHENSIVE REVIEW**

SUPANNIKA WATTANA

Faculty of Engineering and Information Technology
University of Technology, Sydney

A dissertation submitted to the University of Technology, Sydney in fulfilment of the
requirements for the degree of Doctor of Philosophy (Engineering).

2010

CERTIFICATE OF AUTHORSHIP

I certify that the work in this thesis has not previously been submitted for a degree, nor has it been submitted as part of the requirements for a degree, except as fully acknowledged within the text.

I also certify that the thesis has been written by me. Any help that I have received in my research work and the preparation of the thesis itself has been acknowledged. In addition, I certify that all information sources and literature used are indicated in the thesis.

Signature of Candidate

Supannika Wattana

ACKNOWLEDGEMENTS

I would like to express my profound gratitude to my Principal Supervisor, Professor Deepak Sharma for his valuable support, guidance and inspiration over the entire period of this research. His suggestions, comments and constructive criticisms, throughout the preparation of this thesis have enhanced my research skills, analytical thinking and writing style.

Without financial support from the Faculty of Engineering, Naresuan University (NU) and the Energy Policy and Planning Office (EPPO), this research would not have been possible. I also wish to extend appreciation to UTS for providing the IRS scholarship (tuition fee waiver) for autumn 2010.

This thesis could not be accomplished without the assistance from a number of people. Special appreciation is extended to my colleague at NU, Assistant Professor Yongyut Chonbodeechalermroong, for his continual support, encouragement and assistance. Thanks to the staffs of the EPPO, Electricity Generating Authority of Thailand (EGAT), the Metropolitan Electricity Authority (MEA), the Provincial Electricity Authority (PEA), and the Department of Alternative Energy Development and Efficiency (DEDE). Their contribution in terms of providing valuable information was critical for this thesis. Thanks also to Dr. Suwin Sandu for his helpful discussion on input-output analysis.

Through it all, I wish to express my heartfelt appreciation to my family for their love, encouragement and support. I am deeply indebted to my father Somnuek and my mother Suwakhon, who always give me strength to pass through the tough times. I also owe the biggest thank to my husband Buncha, who is my peace, comfort and a good listener.

ABSTRACT

Prompted by the concerns about the poor performance of the Thai electricity industry, the Thai government initiated, in the year 1992, a process of reform of the electricity industry. The reform, argued its proponents, would improve industry performance and provide economy-wide benefits. A comprehensive analysis developed in this research – employing a combination of analytical methodologies, including historical analysis, Data Envelopment Analysis (DEA), input–output analysis, and inferential analysis – has demonstrated that electricity reform has largely failed to achieve its objectives. For example, electricity reform has neither noticeably improved industry performance nor provided any appreciable benefits to the wider economy. This is because the reform program has tended to focus almost exclusively on industry privatization; the accompanying structural and regulatory changes have been limited to the extent that they support privatization. Further, it appears that only financial dimension of reform has received attention and that other dimensions (i.e., social and environmental) have largely been ignored. This narrow focus, this research argues, has its roots in several internal and external developments and influences, for example, pressures from the international financial institutions, major economic crises, political factors, institutions, and other interests. This narrowly-focused reform program, therefore, could not produce desirable outcomes as was expected.

This research identifies some remedies that might be needed in order to improve the efficacy of the present reform program. For this purpose, three alternative reform models (PDP, IPP, and GE) are proposed and their consequences analyzed, through the application of DEA and input–output analysis, for the period 2010–2020. These analyses suggest that the GE scenario, which promotes Small Power Producers (SPPs) generating electricity from renewable sources and envisages import of hydroelectricity from the neighbouring countries, would be an attractive option for Thailand. This is due mainly to its ability to provide a balanced redress for energy, environmental, economic, social, and industry performance objectives. Whether or not such redress will eventuate will however depend – to a large extent – on the efficacy of the ‘new’ institutional arrangements including industry structure, ownership and regulation. This argument is based on the premise that the existing institutional arrangements are deficient and hence unsuitable to provide a balanced redress referred to above.

Against this backdrop, this research proposes a modified reform approach for the Thai electricity industry. The key features of the proposed reform approach include a full

unbundling of the generation and transmission functions of Electricity Generating Authority of Thailand (EGAT), allowing the Independent Power Producers (IPPs) to also establish small-scale power plants, promoting increased participation by SPPs and Very Small Power Producers (VSPPs), disaggregating the Provincial Electricity Authority (PEA) into four regional distributors, and ensuring transparency and autonomy of the regulatory body. This research also proposes some strategies that could be adopted in order to overcome the challenges that are likely to emerge when the proposed reform model is implemented. The proposed reform approach, this research contends, will provide a robust pathway to meet the future electricity needs of Thailand. This is due to the fact that it accords with the economic, environmental, social, and political realities in Thailand. Further, it is contended that this research has made a valuable contribution in terms of developing policy insights that should provide a sound basis for furthering the reform of the Thai electricity industry – an issue of immense contemporary policy significance for Thailand.
